“ **Verification boundary:** This page combines platform design guidance with static evidence from the release. It does not prove that every detected interface is enabled, reachable, secure, or operational in the deployed environment.

Purpose

The platform event and message fabric that carries operational data, commands, status, correlations and workflow events between independently deployable components.

Operational value

Reduces point-to-point integration, gives producers and consumers a common exchange pattern, and lets new automation subscribe without rewriting every application.

Differentiators

Operational messages can carry identity, time, source, semantic type and correlation context rather than being treated as anonymous JSON blobs.

Platform connections

- OpenKnowledge
- OpenTrack
- OpenTask
- OpenEyes
- OpenAnalytics

Verification checklist

- Confirm the component is included and enabled in this edition/release.
 - Record its authoritative service, process/container, port, base URL and health endpoint.
 - Exercise its primary operator workflow and capture expected versus actual results.
 - Verify authentication, authorization, audit, error behavior and data handling policy.
 - Verify OpenBus/OpenKnowledge relationships and time/provenance metadata where applicable.
 - Document known limitations and the release in which they are corrected.
